

# Show case of outbreak-tools usage

Anton Camacho

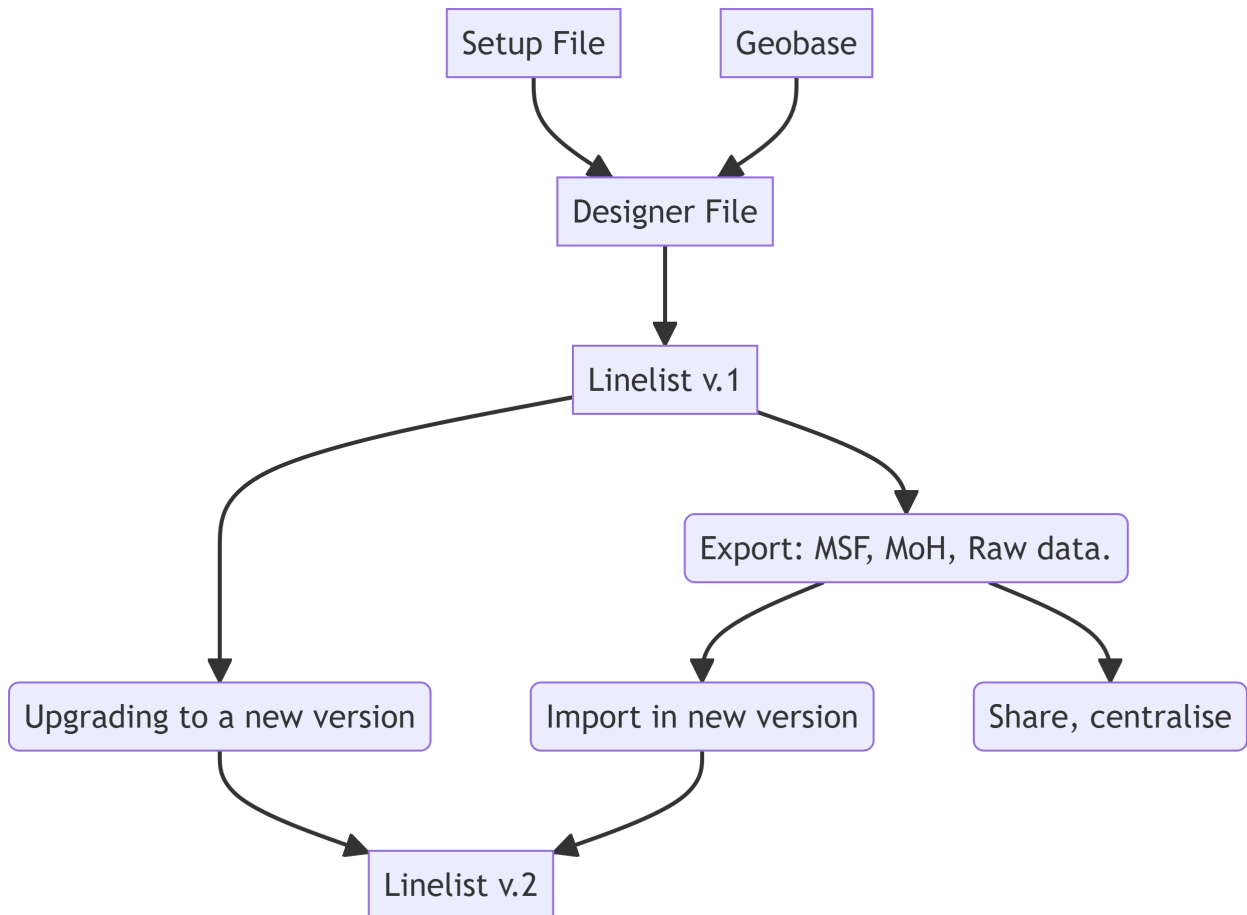

Yves Amevoin

Marine Durthaler

## Introduction

Outbreak-tools is a set of tools to facilitate the creation of linelists in Excel. Among other things, these tools allow you to automate:

- Adding variables (whether drop-down lists, integer or decimal values, or even Excel formulas) and format them.
- Translating a linelist from one language to another,
- Adding analyses to the linelist in tabular form (univariate, bivariate, temporal, spatial),
- Adding graphs to the linelist,
- Import/export the entire linelist or selected variables into specific formats.
- Managing geographic data in the linelist.
- Migration of the linelist as options/variables are added or removed.

The linelist is designed in a configuration file called *setup*. This *setup* file is then loaded into another file that designs the linelist called *designer*. The designer creates the linelist, based on the configurations of the *setup*. The linelist creation procedure is a 3-step process:

- 1- Define your needs in the setup file: The configuration of the file is inspired from Kobo's XLS forms. No in-depth knowledge of Excel is required. A setup file is defined by disease, and can be used to create linelists in several languages.
- 2- Download geographic data for the targeted area: There is [an application](#) available online to download geographic data for the region of interest. It is updated as new geographical information becomes available.
- 3- Generate the linelist by specifying the options in the designer.

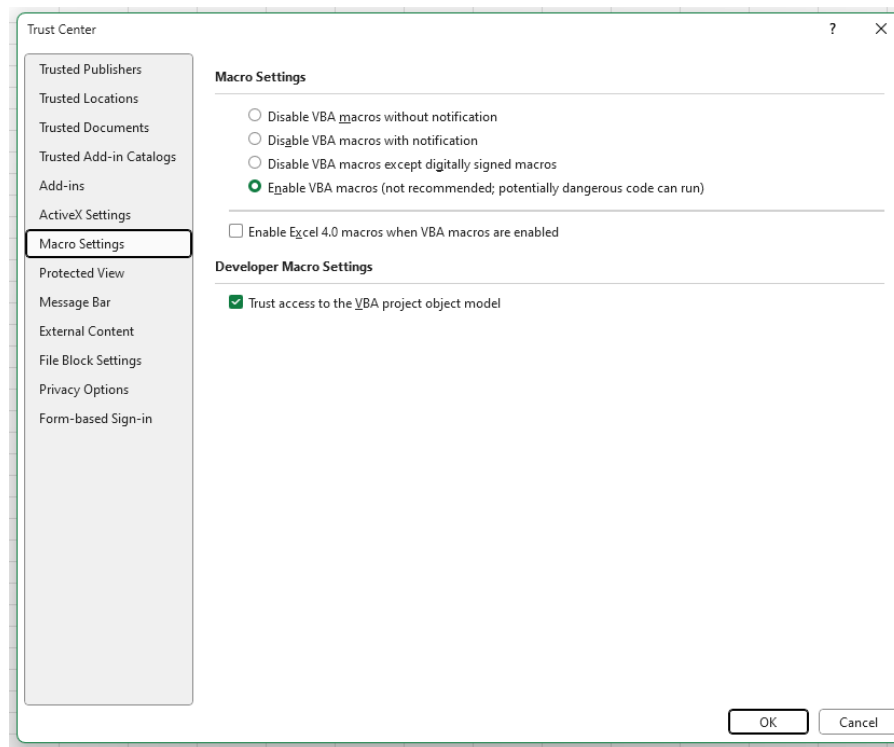

## Exercises

This series of 3 exercises explores the possibilities mentioned above, using a measles setup file. The folders contain all the materials needed to perform the exercises.

### ! Activate macros before exercises

If you're going to run the designer to build a linelist, you'll need to enable VBA macros in Excel, as well as access to the VBA object model:

- 1- Display the *Developer* tab in Excel.
- 2- In the *Developer* tab, click on *Macro security*. Check the options as shown in the following image:

### Exercise 1: Exploration.

- Open the file `linelist_measles_en_ex1.xlsm`. The file password is 5678.
- Browse the linelist sheets.
- Fill in geographical data using the geo-Helper. Select the data you want.

- Explore univariate, bivariate and temporal analyses. Recompute the same analyses by filtering on people under 2 years of age.
- Export the filtered data with the anonymous export for MSF. If you don't change the export password, the password is 605637.

## Exercise 2: Modifying the setup file

- Open the setup file `setup_measles_base_ex2.xlsb`. We want to add the following variables:
  - In the *Admission* section of *Linelist patients* sheet, just before the *hospitalisation* sub-section:
    - \* `muac` (MUAC) which takes three values: “Green (125+mm)”, “Yellow (115-124mm)”, “Red (< 115mm)”
  - In the *Vaccination* section of *Linelist patients* sheet, just after *Vaccination against measles*:
    - \* `vacci_measles_doses` (Number of doses received) which is a numeric variable.
    - \* Add a validation to this variable to make sure it's between 0 and 4.
- Translate the added labels into French
- Check the setup for errors.

### Note

*You should normally have a configuration file identical to `setup_measles_exercise_two.xlsb`. You can also start from this file if you like.*

- Regenerate a new linelist with the designer named `linelist_measles_en_ex2` in the demo folder, making sure you've selected English as the language. You'll use the file `geobase-cod-2023-03-13_20230612.xlsb` as your geobase.
- Import the data `import_linelist_en.xlsx` into the linelist. Look at the data that has not been imported and browse the data in the generated linelist.

## Exercise 3: Analysis

We've decided to add some analyses to the `outcome` file.

- Open the setup `setup_measles_base_ex3.xlsb`.

- In the analyses sheet, add a univariate table showing the number of patients by type of discharge. Add percentages and a graph for this table.
- In the analyses sheet, add a temporal table showing the evolution of type of discharge by notification date. Add a percentage option in row, and add a total.
- In the analysis sheet, add a graph of output types. In graph specifications, represent the number of deaths per notification date, in bars.
- Translate all labels into French
- Check the setup for errors.

**i** Note

*You should get a configuration file identical to `setup_measles_exercise_three.xlsb`. You can also start from this file if you like.*

- Regenerate a new linelist with the designer called `linelist_measles_en_ex3` in the demo folder, making sure you've selected English as the language.
- Import the data `import_linelist_en.xlsb` into the linelist. Browse the generated linelist data.
- Print the **Patient linelist** sheet.
